

Facts on Health and Safety

GREENPOINT BROOKLYN REMEDIATION PROJECT

Surface Stability

Pumping from the recovery wells is not creating holes or voids underground.

Enlargement

- ExxonMobil is monitoring the levels of the plume and groundwater to observe the effects of the drawdown of volume by the recovery systems.
- Only liquids are being recovered and treated. The recovery operation does not include any soil removal that might cause the ground to settle in the area.
- Groundwater levels have remained consistent within normal seasonal variations.
- The volume of water removed from the ground by the recovery systems is much less than historical drawdown from pumping for water supply and past industrial use.
- No settlement of the ground has been observed or is expected.
- Monitoring is conducted on a quarterly basis.
